13 Technology Advanced & Innovative

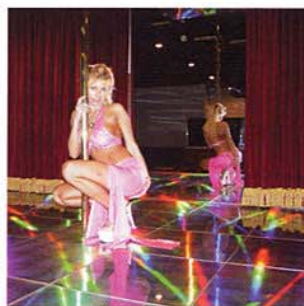

come to life with blazing razor-sharp hues, depth and sharpness with unparalleled clarity, like a multi-colored laser and neon-like light show when illuminated with any conventional light source.

For any club owner wanting to incorporate professionally dramatic lighting effects into their décor, at a fraction of the price of actual elaborate lighting and multimedia equipment and systems, then Holo-Wall products should be up for serious consideration when it comes time to build that new club, addition or remodeling.

Architects take note: suggest Holo-Wall products to add blazing depth, uniqueness and pizzazz to new club interior and exterior designs.

Holo-Glass incorporates the company's semi-transparent holographic films to create vivid dancing patterns of color with such an engrossingly rich depth-of-field (since objects can still be seen through the glass), one feels like they are

scuba diving through vivid colors of tropical seas. Holo-Glass features transparent Holo-Wall films laminated between two sheets of glass, with thicknesses up to one half inch, and they feature the same properties as safety and security glass.

With five holographic patterns to choose from, Holo-Glass has endless applications wherever standard glass is used, such as doors, railings, windows, tabletops, and privacy and wall partitions. The films can also be applied to polycarbonate materials

such as lightweight transparent Lexan to create the same effect it has on glass.

The Holo-Floor system is available in rugged two, three or four-foot square panels up to one inch thick for long-life and durability (high heels be damned). Using the latest in high-impact materials, Holo-Floors can be easily integrated into any new or existing floor for a finish that creates one of the most extraordinary floor designs ever conceived.

Holo-Drapes incorporates the company's ultra-thin holographic metallic films, from the company's Industrial Series, expertly laminated to super-smooth, 13-ounce, flame retardant black vinyl using special laminating techniques. Holo-Drapes allows designers to create walls, floors or ceilings that appear to be constructed of metal without the cost, weight, bulk and fabrication headaches of real metal.

The most dramatic item in the Holo-Drape series is "Black Holography," a process of laminating semi-transparent holographic films onto black vinyl. It remains black until it is illuminated with any light source, but once illuminated it explodes into a cornucopia of dramatic show of thousands of colors that shoot off and undulate in countless directions, especially if the drapes are being subjected to wind movement of any kind.

Got a need for a killer light show? Contact Holo-Walls at (818) 735-3565 or visit www.holowalls.com.

HOLO-GRAPHIC DEVELOPMENTS

The kind folks at Holo-Walls, LLC of Los Angeles, California, producers of holographic films for entertainment, design and architecture, have been a busy bunch since the last time they were covered in these prestigious pages over two years ago and have since produced three new products: Holo-Glass, Holo-Drapes and the Holo-Floor System.
